(I) is useful for identifying a compound with RANK modulactivity, and for identifying a RANK or OPG modulating compound. (I) useful to intelligently design mutants that have altered biological properties and for identifying and/or designing compounds that bind as an approach towards developing new therapeutic agents. (I) is als useful to computationally screen small molecule databases for chemic entities or compounds that can bind in whole, or in part, to RANK or RANKL. The present sequence represents a tumour necrosis factor (TNE family member, TRAIL (1d4v), used in a structural-based alignment st

The invention relates to a composition comprising a protein complex in crystalline form, where the complex comprises an amino acid sequence of a receptor activator of nuclear factor kappaB (NFkappaB) (RANK) ligand (RANK) ectodomain. The three-dimensional structural representation of a RANK ectodomain crystal complex, is useful for identifying a RANK or osteoprotegerin (OPG) modulating compound, and for identifying a RANK or with RANK modulating activity. The crystals permit the determination of the three-dimensional X-ray diffraction structure of the crystal-line polypeptide to high resolution. The atomic structure coordinates and structural information which comprises atomic structure coordinates are useful for identifying bone-forming compounds by methods which utilise the coordinates for solving the three-dimensional X-ray diffraction and/or solution structural information may also be used in a variety of molecular modeling and computer-based screening applications, to for example design mutants of the crystallized RANKL, its receptors, or a portion or fragment of RANKL or its receptors. The coordinates of RANKL crystal, are useful for designing or identifying candidate compounds capable of modulating RANK biological activity, and for identifying compounds which mimic the capability of RANKL to bind RANK molecules, thereby activating the tumour necrosis factor family cytokine, TRAIL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of NFkappaB (RANK)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention discloses isolated, naturally occurring, polypeptide splice variants of human tumour necrosis factor (TNF)-related apoptosis inducing ligand (TRAIL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms. Apoptosis is induced by certain cytokines which include TNF and TRAIL (also referred to as Apo-2 ligand, Apo-2L). TRAIL is a type II membrane protein which induces apoptosis and nuclear factor-B (NF-B) activation in many tissues and cells. Receptors for TRAIL include two death domain

containing receptors, DR4 and DR5, as well as two decoy receptors, DCR1 and DCR2, lacking the intracellular signalling death domain. TRAIL, induced by type I interferons, induces apoptosis in tumour cells, whereas normal cells are relatively resistant without showing significant toxic side effects. Thus, TRAIL has the potential to be a very useful antitumour agent. The naturally occurring splice variants may differ in their cellular distribution, expression levels/ining and activity.

Cheir cellular distribution of spression levels/ining and activity.

Cheir cellular distribution be used in gene therapy, to raise antibodies, to induction of apoptosis of tumours cells. The splice variant polypeptides and polymucleotides can be used in gene therapy, to raise antibodies, to expression of TRAIL, and its splice variants, in a biological sample and to identify compounds which bind the variant TRAIL products and modulate its activity (agonists and antagonists). Pharmaceutical compositions, comprising an expression of the amino acid sequences are useful for causing a cyctoxic effect in cancer cells and for treatment of diseases which can be ameliorated, cured or prevented by lowering or raising the level of the amino acid sequences. The antibodies may also have a therapeutic the amino acid sequences. The antibodies may also have a therapeutic products. Diseases that may be treated include cancer, neurodegenerative development of tissues and aging TRAIL's gene is located on chromosome addisorned (TRAIL) splice variant 8, rpl-6-6, protein which has had an C-terminal section of the conserved TNP domain deleted

                                                                                                                                                                                                                                                  The invention relates to a neutrokine-alpha protein in crystalline form. The crystalline neutrokine-alpha protein is useful for designing molecules that have biological activity or compounds that bind, inhibit or mimic a neutrokine-alpha protein and/or enhance the activity of a neutrokine-alpha protein. The three-dimensional structure of a neutrokine-alpha protein in determining the three-dimensional of other neutrokine-alpha proteins and their homologs. The compounds that mimic, prevent or inhibit the activity of the protein are useful for treating cancer, allergic disorders, or autoimmune diseases such as rheumatoid arthritis, multiple sclerosis, Crohn's disease, diabetes, systemic lupus erythematosus or asthma. This sequence represents the human TRAIL protein amino acids 119-281 which is used in the invention for comparison to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LVRERGPORVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNG
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polypeptide (I) comprising a car or feline TNF-related apoptosis-inducing ligand (TRAIL) sequence and optionally a fusion peptide fused to the polypeptide. Modulators of (are useful for treating an apoptosis-related disorder in a subject. I apoptosis-related disorder is chosen from cancer, neurodegenerative disease, lupus erythematosus, rheumatoid arthritis and multiple sclerosis. (I) is useful for diagnostic evaluation, genetic testing and/or prognosis of angiogenesis-related disorders, such as cancer. T sequence represents a gene encoding a cat soluble TRAIL protein used the invention.

The invention relates to an isolated polypeptide (I) comprising a canine or feline TNF-related apoptosis-inducing ligand (TRAIL) sequence and optionally a fusion peptide fused to the polypeptide. Modulators of (I) are useful for treating an apoptosis-related disorder in a subject. The apoptosis-related disorder is chosen from cancer, neurodegenerative disease, lupus erythematosus, rheumatoid arthritis and multiple sclerosis. (I) is useful for diagnostic evaluation, genetic testing and/or prognosis of angiogenesis-related disorders, such as cancer. This sequence represents a gene encoding a cat TRAIL protein with a V5-His Tag at the C-terminus and used in the invention.
                                                                                                                             Novel isolated canine or feline TNF-related apoptosis-inducing polypeptide, useful for diagnostic evaluation, genetic testing prognosis of angiogenesis-related disorders, such as cancer.

US-08-670-354-2

Sequence 2, Application US/08670354

Patent No. 5763223

GENERAL INFORMATION:
APPLICANT: Reymond G. Goodwin.
TITLE OF INVENTION: Cytokine That Ind
APPLICANT: Reymond G. Goodwin.
TITLE OF INVENTION: Cytokine That Ind
APPLICANT: Reymond G. Goodwin.
TITLE OF INVENTION: Society
CORRESPONDENCE ADDIRESS: 9

CORRESPONDENCE ADDIRESS: 9

CORPUTER: Seattle
STAME: WA

COUNTRY: USA
ZIP: 98101

COMPUTER: Rapple Macintosh
OPERATING SYSTEM: US/08/670,354

FILING DATE: 25-UN-1996

CLASSIFICATION DATA:
APPLICATION NUMBER: US/08/670,354

FILING DATE: 29-UN-1995

CLASSIFICATION NUMBER: US 08/496,632

FILING DATE: 29-UN-1995

CLASSIFICATION NUMBER: US 08/548,368

FILING DATE: 29-UN-1995

CLASSIFICATION NUMBER: US 08/548,368

FILING DATE: 10-NOV-1995

CLASSIFICATION NUMBER: 32,172

REFERENCE/DOCKET NUMBER: 32,044

TELECOWMUNICATION A35

ATTORNEY/AGENT INFORMATION:
TELECOWMUNICATION A35

ATTORNEY/AGENT INFORMATION:
TELECOWMUNICATION A35

ATTORNEY/AGENT INFORMATION:
TELECOWMUNICATION A35

REFERENCE/DOCKET NUMBER: 32,172

REFERENCE/DOCKET NUMBER: 32,172

REFERENCE/DOCKET NUMBER: 32,172

REGUENCE CHARACTERISTICS:
LENGTH: 281 amino acids

TYPE: amino acids

TYPE: amino acid

TOPOLOGY: linear

MOLECULE TYPE: INVENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ALIGNMENTS
